

The transfer request from BSC to MNT is detected, and the transfer data is written into the database. The program detects the transfer request from BSC to MNT recorded in the database, transfers the requested transfer data to the binding address and writes it back to the database. Otherwise, the same is true

notice

```

• const BSC_TEST = Common.forCustomChain('mainnet', {name: 'bnb', networkId: 97, chainId: 97}, 'petersburg');
• const BSC_MAIN = Common.forCustomChain('mainnet', {name: 'bnb', networkId: 56, chainId: 56}, 'petersburg');

// mainnet
• //const web3 = new Web3('https://bsc-dataseed1.binance.org:443');
• // testnet
• const web3 = new Web3('https://data-seed-prebsc-1-s1.binance.org:8545');
